What is EDR?

[Source: G2 Report ↗](#)

Endpoint detection and response (EDR) software is the newest member of the endpoint security family. EDR tools combine elements of both endpoint antivirus and endpoint management solutions to detect, investigate, and remove any malicious software that penetrates a network's devices. EDR solutions give greater visibility of a system's overall health including each specific device's state.

Companies use these tools to mitigate endpoint penetrations quickly and prevent data loss, theft, or system failures. They are typically used as a complement to larger security systems such as security information and event management (SIEM), vulnerability management, and incident response tools.
